

The diagram illustrates a complex system or process. The various colored regions represent different components or states. The blue and light blue areas at the top and middle suggest a primary or initial state. The purple regions, particularly the large one on the right, represent a secondary or transformed state. The red bar in the lower-left quadrant is a distinct feature, possibly indicating a boundary or a specific condition. The light blue and white blocks at the bottom represent a final or residual state. The connections between these regions indicate the flow or relationship between different parts of the system.
