1. **Introduction**

The purpose of this study is to investigate the effects of the proposed system on the performance of the participants.

The study was conducted in a laboratory setting with a sample of 20 participants.

The results of the study show that the proposed system significantly improved the performance of the participants.

The study also found that the proposed system was easy to use and did not cause any adverse effects.

The study was limited to a laboratory setting and a small sample size.

Further research is needed to investigate the effects of the proposed system in a real-world setting.

The study was funded by the National Science Foundation.

The authors would like to thank the participants for their contribution to the study.

The results of the study show that the proposed system significantly improved the performance of the participants. The mean performance score for the proposed system was significantly higher than the control system. The standard deviation for the proposed system was also significantly higher than the control system. This indicates that the proposed system not only improved the mean performance but also increased the variability of the performance scores. The study was limited to a laboratory setting and a small sample size. Further research is needed to investigate the effects of the proposed system in a real-world setting.
