1. **Introduction**

2. **Methodology**

The study was conducted in a laboratory setting. The participants were recruited from a local university and were screened for any conditions that might affect their performance. The experiment was divided into two main phases: a familiarization phase and a data collection phase. In the familiarization phase, participants were introduced to the equipment and the tasks they would be performing. This phase was designed to ensure that all participants were comfortable and familiar with the setup before any data was collected. The data collection phase consisted of several trials, each with a specific protocol. The participants were instructed to perform the tasks as accurately and as quickly as possible. The data collected during this phase was used to analyze the effects of the independent variables on the dependent variables. The results of the study are presented in the following sections. The first section discusses the overall findings, while the second section provides a detailed analysis of the individual variables. The final section discusses the implications of the study and suggests areas for future research. The study was conducted in a laboratory setting.
